

## 150mm Gun v. T-34's

## BUT THIS TIME...

the 150's all area-fire into the ground alongside the T-34s and within only 13 secs (note clock) 7 of them are wrecked!

(the surviving 3 panicked forward out of the area-fire zone and survived the turn)

**CONCLUSION** - area-fire impacting the ground near a tank can be more lethal than a direct-fire hit on it. (thanks to Peek for pointing this out)

No doubt the very thin bottom armour is prone to groundbursts, especially those that explode directly beneath the tank.

PS - I ran another test using small German 75mm iGs, with direct-fire they bounced off the T-34's just like the 150s did (apart from the odd immob and/or damaged gun), then I tried it again with area-fire but they still couldn't hurt the T-34's much

**OBLIVIOUS CONCLUSION** - Area-fire damage is most severe if done by larger calibres
