

Gun ratings

An at-a-glance series of charts comparing gun capabilities.

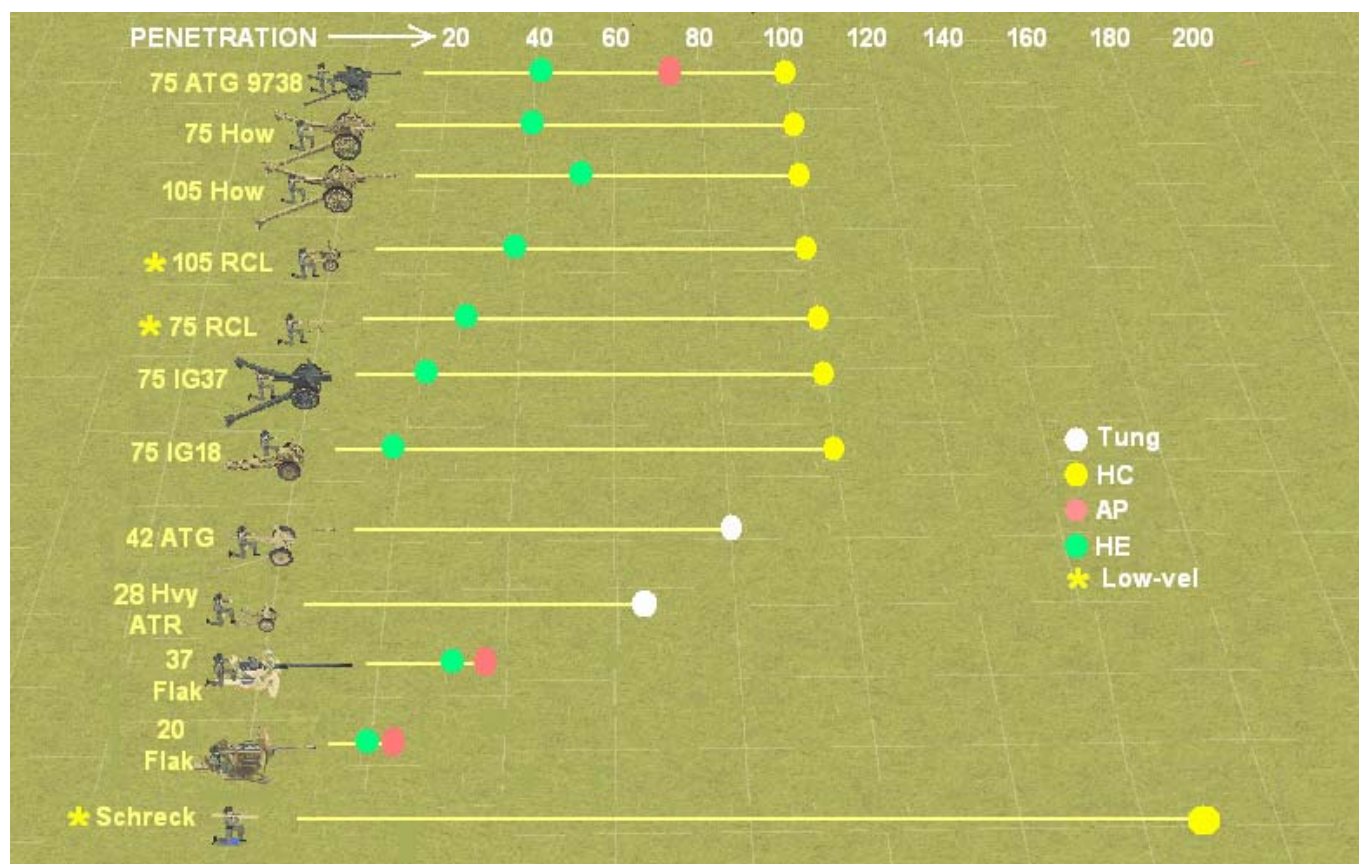

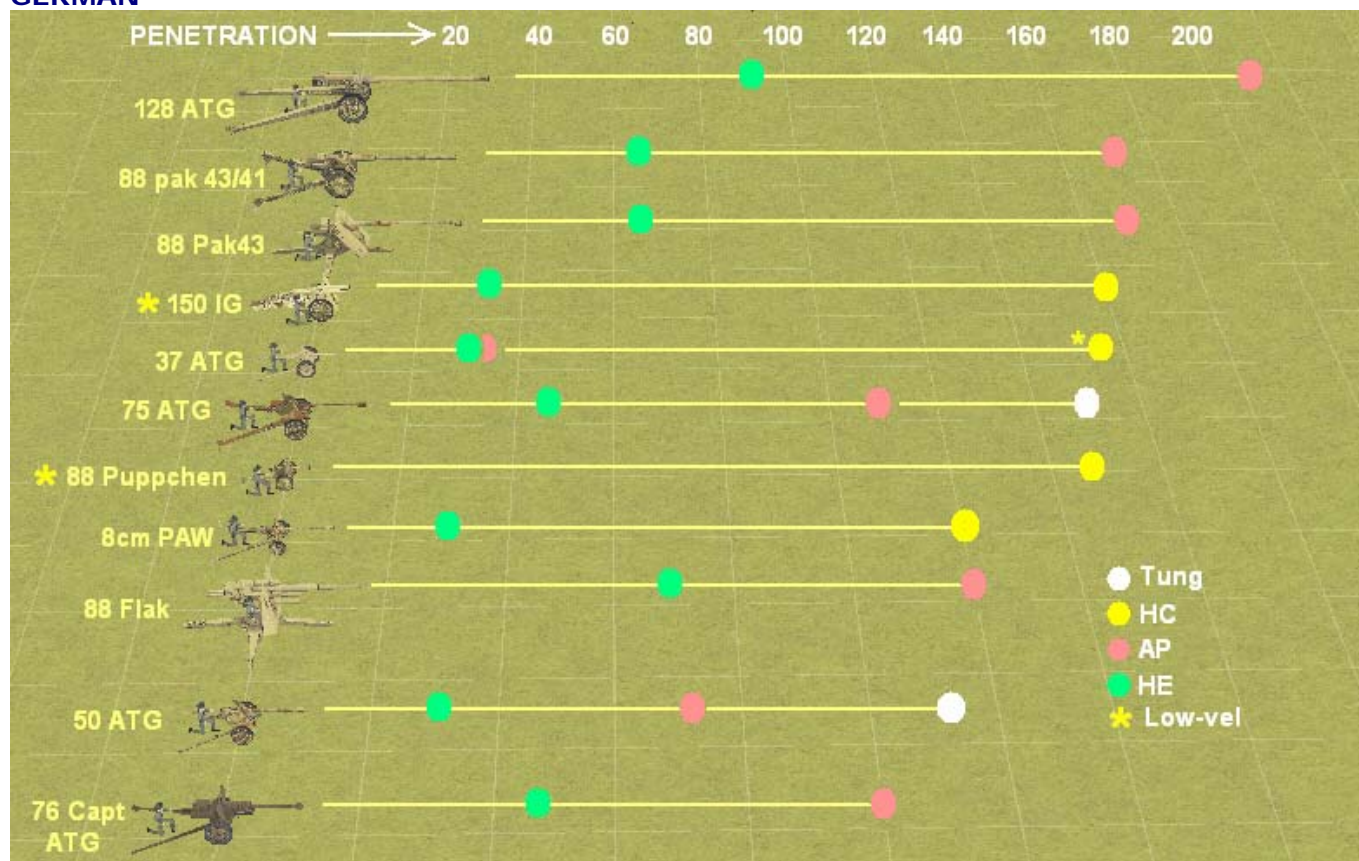

Example -the 128 ATG has a phenomenal penetration of over 200mm with AP-shot (red dot), but less than 100mm with HE (green dot).

Note - some guns could fire a mix of shot, but tungsten and hollow-charge were often not available early in the war.

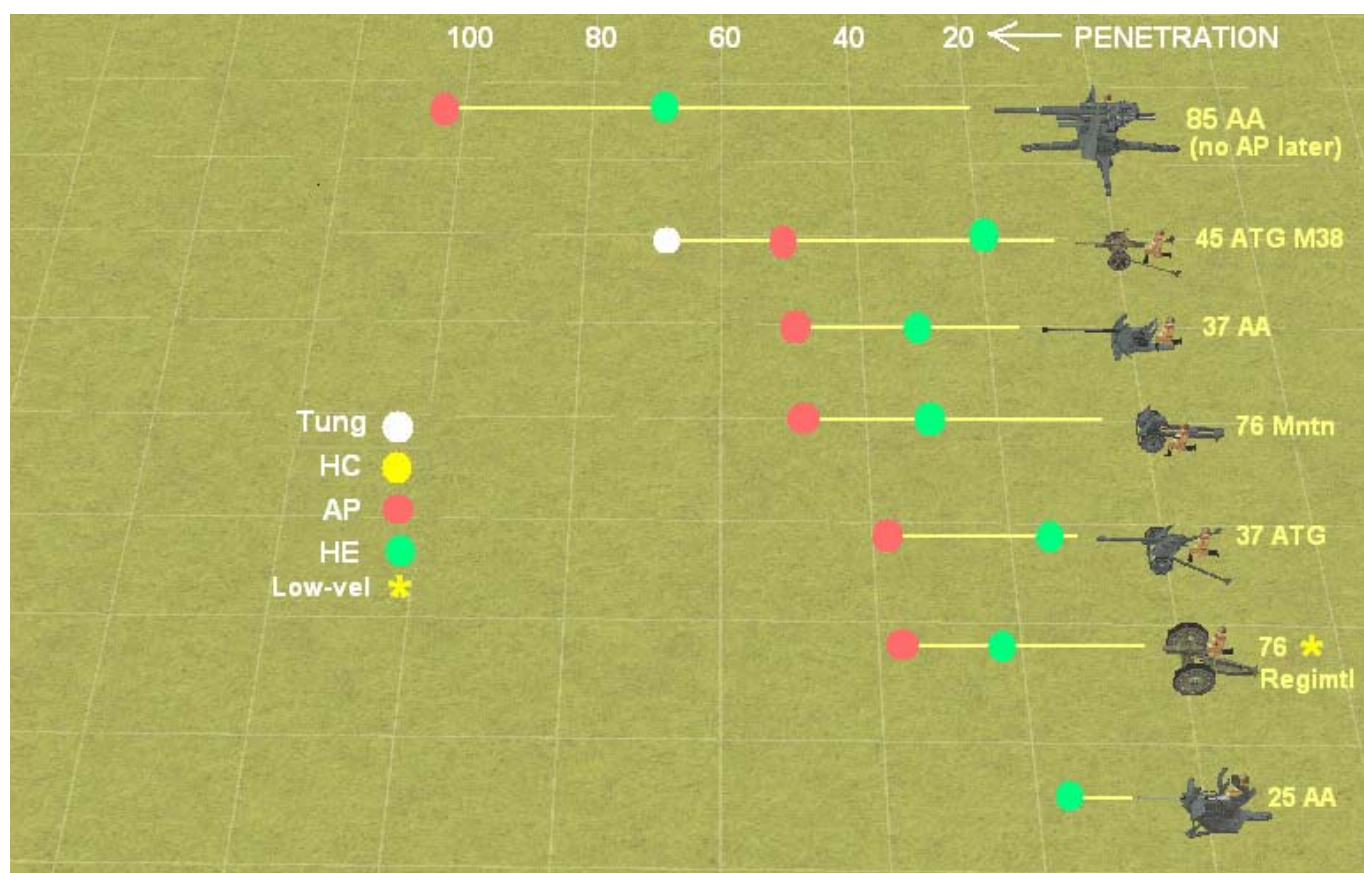

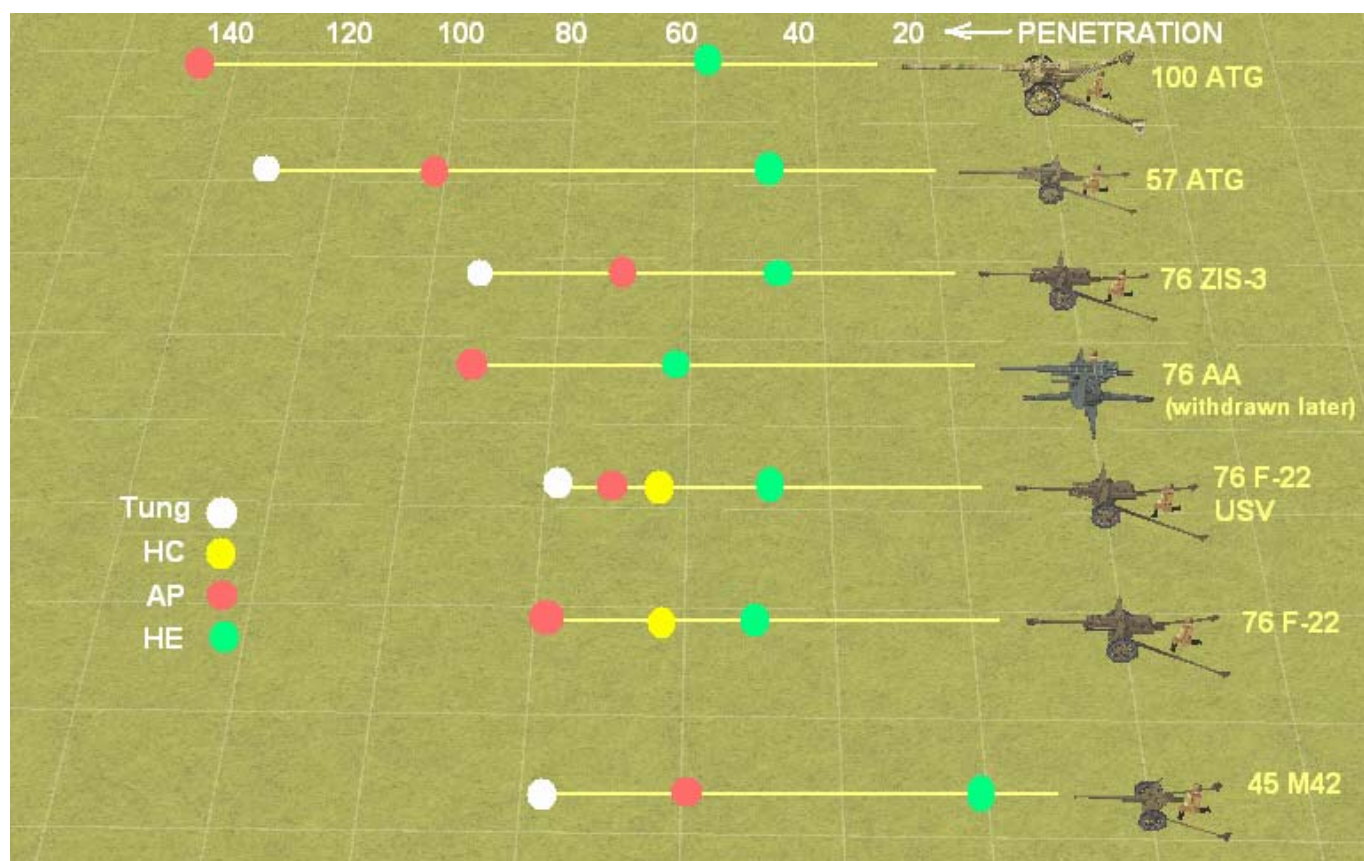

Note - yellow asterisks denote low-velocity guns (under 400 metres per sec muzzle velocity), and were inaccurate at longer ranges.

PS - ammo quality and technology improved during the war, I've shown the best ammo in all my charts, so bear in mind that earlier in the war certain ammo types may not have had quite the same punch, (for example German 75mm HC was weaker earlier on)

GERMAN

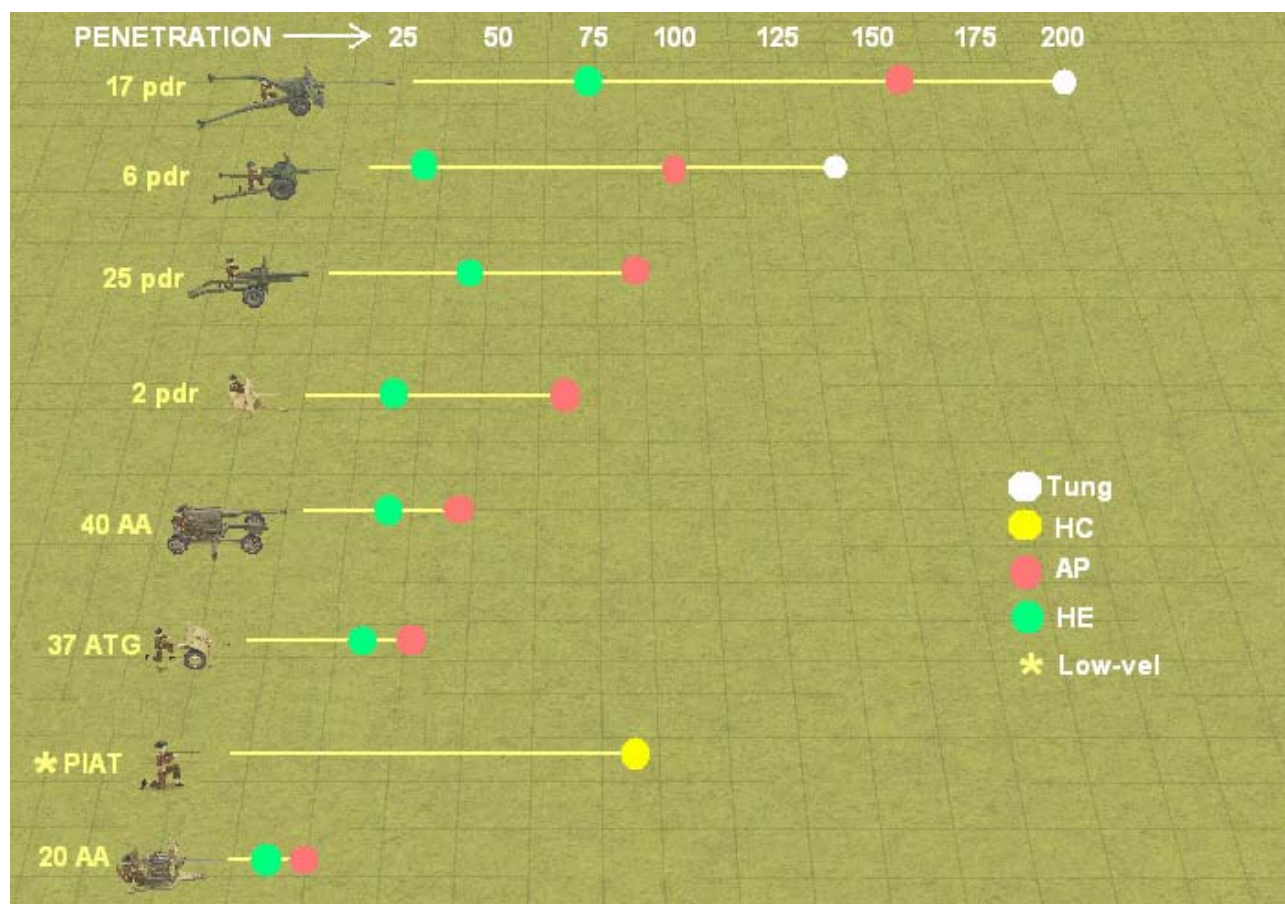

RUSSIAN

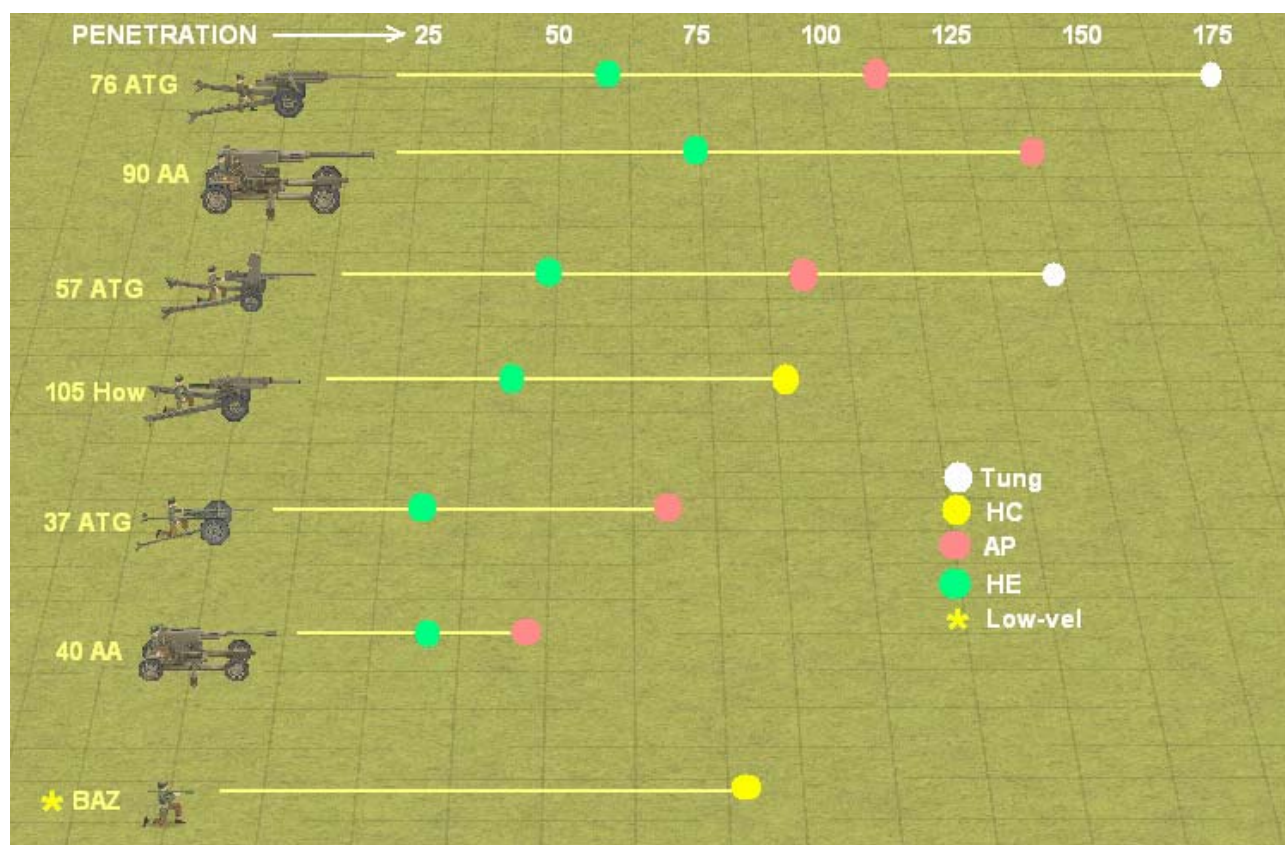

BRITISH

ATG's shouldn't count on getting tungsten and HE early on.

AMERICAN

ITALIAN

(Some of these guns only became available later on)
